|-----------------------------------------------------------------------------------------------------------|-----------|
| Preface . . . . .                                                                                         | v         |
| <b>I. Deformation quantization and geometric quantization</b>                                             | <b>1</b>  |
| Path integral quantization for a toroidal phase space                                                     |           |
| B. G. Bodmann and J. R. Klauder . . . . .                                                                 | 3         |
| GNS-representations and KMS-states in deformation quantization                                            |           |
| M. Bordemann . . . . .                                                                                    | 11        |
| Hall's coherent states, the Cameron–Martin theorem, and the quantization of Yang–Mills theory on a circle |           |
| N. P. Landsman and K. K. Wren . . . . .                                                                   | 23        |
| Continuous Hochschild homology for algebras of smooth functions                                           |           |
| M. J. Pflaum . . . . .                                                                                    | 37        |
| Berezin–Toeplitz quantization and Berezin symbols for arbitrary compact Kähler manifolds                  |           |
| M. Schlichenmaier . . . . .                                                                               | 45        |
| Non-commutative Hardy spaces and Berezin–Toeplitz quantization                                            |           |
| H. Upmeyer . . . . .                                                                                      | 57        |
| <b>II. Fundamental problems in quantization</b>                                                           | <b>71</b> |
| New measures for the quantization of systems with constraints                                             |           |
| J. R. Klauder . . . . .                                                                                   | 73        |
| Evolution loops and $\text{spin-}\frac{1}{2}$ systems                                                     |           |
| D. J. Fernández C. and O. Rosas-Ortiz . . . . .                                                           | 81        |
| Quantum mechanics in finite dimensional Hilbert spaces: factorization properties                          |           |
| J. Tolar . . . . .                                                                                        | 89        |
| <b>III. Coherent states, wavelets, and quantum optics</b>                                                 | <b>97</b> |
| Quantum interference in phase space                                                                       |           |
| K. Banaszek and K. Wódkiewicz . . . . .                                                                   | 99        |
| Wavelets in Sobolev spaces and applications                                                               |           |
| F. Bastin, C. Boigelot, and P. Laubin . . . . .                                                           | 113       |

|                                                                                                   |                |
|---------------------------------------------------------------------------------------------------|----------------|
| <b>Coherent states, phases, and symplectic area of geodesic triangles</b>                         |                |
| S. Berceanu . . . . .                                                                             | 129            |
| <b>Wavelets for solving inverse problems</b>                                                      |                |
| C. De Mol . . . . .                                                                               | 139            |
| <b>Symmetry, coherence, and an invariant treatment of unpolarized light</b>                       |                |
| V. P. Karassiov . . . . .                                                                         | 153            |
| <br><b>IV. Gravity and quantum gravity</b>                                                        | <br><b>163</b> |
| <b>Trautman–Bondi mass for scalar field and gravity</b>                                           |                |
| J. Jezierski . . . . .                                                                            | 165            |
| <b>Global properties of 2D space-time and quantization</b>                                        |                |
| G. Jorjadze and W. Piechocki . . . . .                                                            | 181            |
| <b>Quantization of gravity: yet another way</b>                                                   |                |
| I. V. Kanatchikov . . . . .                                                                       | 189            |
| <b>Rotating dust models in relativity</b>                                                         |                |
| A. Krasinski . . . . .                                                                            | 199            |
| <b>Midisuperspace model for pure gravitational plane waves</b>                                    |                |
| G. A. Mena Marugán and M. Montejo . . . . .                                                       | 213            |

**Quasi-invariant measures on the group of diffeomorphisms of the circle and their unitary representations**

E. T. Shavgulidze . . . . . 281

**VI. Noncommutative geometry 285**

**Noncommutative Bloch theory: an overview**

M. J. Gruber . . . . . 287

**Differential calculus on inhomogeneous quantum groups**

M. Lagraa and N. Touhami . . . . . 295

**The time-thermodynamics relation and time evolution of quantum systems**

D. Lapanik . . . . . 303

**On generalized statistics and interactions**

W. Marcinek . . . . . 309

**VII. Integrable systems 317**

**A note on fractional KDV hierarchies II. the bihamiltonian approach**

P. Casati, G. Falqui, and M. Pedroni . . . . . 319

**Superposition formulas based on nonprimitive action**

M. Havlíček, S. Pošta and P. Winternitz . . . . . 327

**Lax formulation of generalized  $SU(2)$  chiral models**

L. Hlavatý . . . . . 335

List of Participants . . . . . 339
